We will meet during our assigned final period: Wednesday, Dec. 10 from 10-12.

NOTE: A number of documents for the course will be posted on EduCat for you to print out for use during class time. Most assignments, along with clarifications or elaborations of assignments, will be posted there. Also, check your nmu.edu email account regularly for emails about the course.

Brief Description of the Course:

This course is designed to acquaint prospective elementary teachers with contemporary methods and materials employed in the teaching of mathematics in the elementary school. We do this by exploring how children learn mathematics and how teachers design activities that help students achieve mathematical goals. My approach to teaching and learning mathematics is consistent with the Michigan Curriculum Frameworks and the National Council of Teachers of Mathematics’ Principles and Standards for Teaching Mathematics.

A few seconds reflection will make it obvious that this course cannot teach you how to teach each and every topic in the K-8 math curriculum. My goal is to help you develop the ability to use various curricular materials to plan lessons that you will teach using appropriate methods. Naturally, I have views on appropriate teaching methods. These views are based on my experiences as an elementary (mostly first grade) and university teacher and as a researcher of teaching and learning. My beliefs about mathematics teaching align with those contained in the documents listed above and those of our text. While you may disagree (and express that disagreement) with the methods advocated by the authors of these documents (and by me), to pass this course you must demonstrate that you understand the methods and philosophy advocated. (You cannot justify disagreeing with concepts if you don’t first understand the concepts.)

As this is a mathematics methods course, we will focus on using mathematics in teaching. There are two aspects involved in using mathematics in teaching and we will work on both: (a) having a robust sense of what it means to be proficient in mathematics, and (b) understanding and being able to use mathematics in ways needed for the work of teaching.

First, teachers need to appreciate what kinds of understanding and skill they would like their students to develop. So we ask: What is involved in knowing and doing mathematics proficiently? In reading and language arts, most teachers have a highly developed sense of what it means to be literate. Understanding what the analogue is in mathematics is more elusive.

This course is designed to help you consider what it means to be mathematically capable. Here is a provisional definition: mathematical proficiency involves conceptual understanding, procedural fluency and skill, and the use of a variety of mathematical practices—skills, tools, and habits of mind and action—important to learning, doing, and using mathematics. Examples include using mathematical language, justifying claims and solutions, and developing and comparing...
representations. Being mathematically proficient also includes confidence in one’s own capacity and a sense of how to work productively.

Second, teaching mathematics requires a great deal of specialized mathematical knowledge and reasoning. Your own understanding, fluency, and comfort with mathematics will be important to your effectiveness as a teacher. Teaching depends on mathematical understanding and skill that differ from the kind it takes to do well as a math student or to be good at other jobs that require mathematics. In planning lessons, teachers need to determine the mathematical goals of activities, anticipate the varied ways students might respond, and prepare mathematically for what might happen as the lesson unfolds. Teachers must prepare good questions to ask and generate easier as well as harder versions of the problem, either as a back-up plan or as a way to focus or extend students’ work. In order to hold high expectations of students, teachers need a keen sense of the complexity of particular mathematical ideas, and ways they can be scaffolded for students’ learning.

We will work this semester on developing mathematical knowledge that is useful for teaching, and on learning to use mathematics as teachers. Our focus is the mathematical content of, for example, place value with whole numbers and decimals; the meanings of the operations of addition, subtraction, multiplication, and division; and procedures, place value meanings, and representations for whole and decimal number computation. Within topics, we will also work on mathematical practices, focusing particularly on the use of mathematical language, representations, and mathematical reasoning. Once we know the content you will be teaching at Bothwell, we will focus our explorations in that area.

One semester is a short time to achieve the goals sketched above. If you work hard and attentively, you will begin to do mathematics teaching, as well as analyze it. You will develop skills of watching and listening that enable you to make sense of how others think mathematically and express themselves in multiple ways. You will begin to develop practices that enable you to attend and respond to students’ mathematical ideas and ways of thinking, and to plan, teach, and analyze mathematics lessons. You will elaborate your knowledge of some areas of mathematics in ways that ready that knowledge for the specific work of teaching it.

Working on these elements of mathematics teaching will enable you not only to get started, but also to go on learning from practice. One of my goals is for you to learn how to learn teaching. This involves learning how to study and examine practice, and to develop criteria for judging alternative instructional decisions and moves. In short, it means asking, exploring, and experimenting with the teaching of mathematics in school, in ways that make children’s ideas central to the work, and that preserve the mathematics with intellectual rigor and integrity.

Prerequisite: Admission to the methods phase of teacher education; at least a C in MA 150 and MA 151.

General Requirements:
- Professional behavior and attitude at all times
- A genuine interest in learning the subject matter
- A sincere interest in the needs of elementary students
• Being a valuable and contributing member of our class
• Questioning rather than passing judgment
• Reflecting excitement about teaching and learning
• A spirit of cooperation with and support for your peers
• Grammatically and mathematically correct language in discussions and in assignments
• Involvement in our class—not writing papers or studying for another class, not checking your calendar, texting, etc. Students engaged in such activities will lose participation points.
• Appropriate Classroom Laptop Use: Although laptops in class open up new learning possibilities for students, sometimes students utilize them in ways that are inappropriate. No instant messaging, e-mailing, surfing the Internet, playing games, writing papers, doing homework, etc. during class time. Acceptable uses include taking notes and working on assigned in-class activities, projects, and discussions that may be enhanced by laptop use. It is easy for your laptop to become a distraction to you and to those around you. Inappropriate uses will be noted (silently) and will result in loss of a grade in participation points. If you use your laptop during class, at the end of the class period you will be expected to email me the notes you typed in class (I will not ask for them but will keep records of those who do/do not.).

• Do NOT use your cell phone during class—including for texting. Turn your cell phone off—not to vibrate. A student using his/her cell phone is not participating in the classroom activities—his/her attendance and participation points will reflect this. Anything can wait a maximum of 1 hour and 20 minutes. (Consider whether you would want your future students texting while you are teaching. The same applies here.) Note that, just because you have the phone in your lap & your hands below the surface of the desk does not mean I cannot tell that you are texting.
• Attendance at all class sessions. If you must miss a class for medical reasons, you are expected to submit an excuse from your medical provider.
• Participation is an important part of the class—and hence, your grade. This means that you must be on time and prepared (read assignments, prepared materials, completed homework, etc.) for all class sessions. There will be times when we work individually, in small groups, or as a whole class. You will be expected to participate in all types of work/discussion to help develop understanding of teaching mathematics in the elementary school. Participating means volunteering to answer questions and asking questions in the whole class discussions, not just in small groups. Not participating because you are “shy,” feel “intimidated by mathematics,” or fear “looking stupid” is a hindrance to learning and will lessen your growth as a teacher.

Assessment (further details will be provided in class, via email, or on EduCat as necessary, feel free to ask questions about any assignments—the earlier, the better).

When completing assignments please remember that I am not a mind reader. One of the roles of a teacher (me, in this case; you, in the future) is assessment. To assess your learning, I must be able to understand what you are thinking—your goal is to communicate what you are learning. This requires clarity and precision on your part. I expect careful editing of assignments you submit. Excessive grammatical and spelling errors will affect your grade. (Do not assume the spell check knows whether you mean their, there, or they’re; students or student’s or students’, etc.)

• Attendance and participation. (75 pts)
• A number of individual/group lesson plans and/or sequences of lesson plans (point values will increase across the semester as your learning, experience, and ability increase; see attached “Lesson Plan Requirements” for lesson plan expectations). **ALL** lesson plan assignments are to meet **ALL** the requirements listed unless otherwise specified.

• As part of your Bothwell experience, your group (assigned by Block 2 faculty) will create a sequence of mathematics lesson plans. The lessons are to build upon each other (i.e., a mini-unit). In general, the lessons will not be review or practice (though, of course, they may include some). The major goal is for you to demonstrate your understanding of the NCTM Standards and how the Standards might look in practice. During the semester, I will be available to meet with each Bothwell group. If you choose to meet with me, we will discuss your ideas for mathematics content and pedagogy. (30 pts for the group’s joint work and 70 pts for the individual lesson plans you design; see attached “Lesson Plan Requirements” for expectations)

• A reflection on your Bothwell teaching experience. This an individual reflection on your own teaching experience. (40 points; see attached “BMS Reflection Assignment”)

• You will be assigned readings from the text, preparation of materials, and various other out-of-class work. Questions may also arise from in-class activities and discussions. For some of these, you will write responses for homework. (generally 10 to 20 pts ea—about 80-120 pts total)

• Several quizzes which will be given during the last portion of some class periods (students may leave as they finish). Questions will generally come from the assigned readings and “Writing to Learn” or “For Discussion and Exploration” questions at the end of chapters in the text. (10-15 pts ea—50-75 pts total)

• There is a field work component to this class. You will visit Lakeview Elementary School in Negaunee nine or ten times during the semester. Details about determining when, which classroom, etc. will be provided by representatives of the School of Ed. Associated with these visits will be a series of five written assignments that are attached. The assigned order is flexible. You should write the first reflection first but the others may be submitted in a different order—but CLEARLY identify which reflection you are submitting. (20 pts each—100 pts total)

All written assignments are to be typed, double-spaced, and submitted in hard copy form (not e-mailed). Margins should be 1 inch. (This specificity of format is to allow me space in which to write comments.) When you refer to a book, article, or other source, you must provide a full citation. When you use resources to generate ideas for lesson plans, etc., you must also provide a full citation. (If you are unsure how to cite, look at the citations in our text. Web citations must be complete enough for me to easily access the same webpage.)

All work completed for this class must be original. I expect each individual to think, write, reflect, question, and even sometimes struggle through the concepts presented in class, the text, and other readings. This is the only way you will learn and grow as a teacher. Students who commit academic misconduct, including plagiarizing work (copying or borrowing heavily from published materials), or copying or borrowing heavily from another student’s work will fail this class. The university holds Academic Misconduct as a serious and punishable infraction.

Feel free to contact me (in my office, via e-mail, before/after class, etc.) when you feel you need help. I am happy to discuss assignments before they are due and have resources that I am willing to share (these may be especially helpful for the lessons you teach). Do **NOT** wait till the last minute (e.g., the day before you will teach or a major assignment is due) to seek help! Contact me if you do not
understand the way I am grading assignments or if you are concerned about the grades you are 
receiving. If something becomes an issue, contact me immediately—do not wait till the last week of 
the semester.

Grades will be on the following scale:

<table>
<thead>
<tr>
<th>Grade</th>
<th>Percentage Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>93-100 percent</td>
</tr>
<tr>
<td>A-</td>

Learning Outcomes:

Upon successful completion of this course, a student should be able to:

1. Utilize a problem solving pedagogy as the basis for helping elementary and middle school students 
   learn mathematical concepts.
2. Learn to use a student-centered, active, hands-on approach in the teaching of mathematical concepts.
3. Learn to use manipulatives and models to help children develop mathematical concepts.
4. Develop a repertoire of examples, models, activities, and games for teaching elementary and middle 
   school mathematics.
5. Analyze curriculum in light of current standards and principals as laid out in documents such as the 
   Common Core Standards and NCTM's "Curriculum and Evaluation Standards for School 
   Mathematics" and "Principles and Standards for School Mathematics."

Evaluation of these learning outcomes will be done through assignments, quizzes, field work 
experience, and classroom participation.

If you have a need for disability-related accommodations or services, please inform the Coordinator 
of Disability Services in the Dean of Students Office at 2001 C. B. Hedgcock Building (227-1700). 
Reasonable and effective accommodations and services will be provided to students if requests are 
made in a timely manner, with appropriate documentation, in accordance with federal, state, and 
University guidelines.
Lesson Plan Requirements

These requirements apply to all lesson plans assigned unless otherwise noted during the semester.

Lesson plans created by people learning how to teach are different than those created by experienced teachers. The latter have both the experience of writing extensive LPs when they were students and the experience of teaching from LPs. They have learned what questions are important to ask themselves, what to consider when planning. Novices (like you) do not yet have such experience. Hence, your LPs will be extensive (i.e., LONG). As you create LPs, remember that planning includes: specifying exactly what problems you will pose; stating exactly what questions you will ask using correct language appropriate for the grade level; etc. Do not use words like “explain,” “discuss,” and “review” in your LPs. If you will explain (discuss, review) something, state exactly how you will do so, what language you will use, etc. I will be looking for LPs that have been carefully thought through.

You are not expected to re-invent the wheel. Feel free to make use of resources for planning lessons. Provide references for any resources you use. Do not assume that, because a lesson plan is on the web (or anywhere else), it is necessarily a lesson plan that reflects the NCTM Standards—even if it claims to do so. Your goal is to design lessons that conform to the NCTM Standards. That is on what you will be graded. (Using references does NOT mean copying others’ lesson plans. You may get ideas for lessons but the plan is to be designed by you.)

As you plan, refer to Chapters 3, 4, & 5 (including the expanded lesson plan at the end of 4) and our discussions about them.

You may use any lesson plan format but it must include (& I must be able to identify) the following content (order is flexible):

- What are your mathematical goals?
  These should be learning goals—indicate what the students will (hopefully) understand after the lesson that they did not before. Learning goals refer to mathematical concepts; they are not what the students will do. Understanding is not about what students are “able to do.” I.e., not “They will solve problems.” not “They will measure shapes.” not “They will be able to add two digit numbers.” etc. “Students will be able to” goals should be part of your LPs but must not be the only type of goal you list. The “able to do” goals should help students meet the “understanding” goals. It would not hurt to look at the lesson plans in our text and the early parts of the chapter in the second part of our text that relates to the content of your lessons. Also, MA 353 students often write goals such as “students will understand how to …” This is really a procedural goal (how to do something is following a procedure) with the word “understand” thrown in. It is not what I’m looking for. An example of an understanding goal related to addition is: “The students will recognize that addition is the combining of two (or more) groups. The groups are combined and make a new group. The sum tells you how many are in the new group.” An example of an understanding goal related to subtraction is: “The students will understand that one type of subtraction involves the comparison of the size of two groups. ‘How many more’ tells you how much larger one group is than the other.” [Note: Yes, this view of goals contrasts with what some in the School of Ed hold. However, it is what I expect from you.]

- What will the teacher do? What will the teacher say? What will the teacher ask? Planning means that you have thought through what you might say, how you might ask questions that promote students’ mathematical reasoning and problem solving.
• Don’t say things like, “The teacher will explain the concept.” This is completely generic & does not tell me what you are thinking—or suggests you have not spent the time to think through what you intend to say. What will you say to explain the ideas to the students? But, also consider whether you need to explain at all (recall what our text says about teacher explanations).

• Don’t say, “We will discuss …” This too is generic & does not tell me what you are thinking. If you will have a discussion (which you generally should), give examples of what you would say/ask & what you would expect of students in response. Why are you discussing? What ideas do you intend the discussion to elicit? How will your questions elicit these ideas from the students? The discussion and your questions should help the students achieve the understanding goals of the lesson.

• Don’t say, “I will ask the students if they understand.” Think about yourself as a student when teachers ask this question; few students willingly admit they do not understand—esp. when the rest of the class indicates they do. However, it is important to be able to discern if the students do understand. How you do so should appear in the assessment section of the plan. Indication of understanding comes from the students but not in the form of yes or no. They must articulate the concepts of the lesson for the teacher to know if they understand them.

• If, say, your lesson is about geometry, don’t say, “I will present shapes.” Be explicit about what shapes you will present, in what order, and why these shapes & this order. Provide copies/diagrams of each of the shapes exactly as you will provide them. This is part of planning—and necessary for me to assess the quality of your LP.

• What will the students do? (If the lesson has multiple parts, you should provide this information for each part.)
  • Will they be in their desks, at the board, writing, drawing, etc?
  • Will they be using manipulatives? How will they obtain them? When will it be appropriate for the students to have them? (Too early and they may be playing rather than listening to instructions.) How will they be introduced to them (if this is a first experience with them)?
  • Will they work individually? Pairs? Groups? If groups, what size groups? Whole class?

• How will you “wrap up” the lesson? What will be in the “After” portion of the lesson? This should be more than just “Thanks, good job.” It should be more than just, “What did you learn?” Closure should help students put together ideas brought out in the lesson; it should help students reach your goals. Note: the teacher should not be the one putting the ideas together. You should plan specific questions that help students put the mathematical ideas together. E.g., “When we made all the rectangles with 24 square tiles, what did you notice about the relationship between the shape of the rectangle and the perimeter?”

• What is the mathematics available from the activity? What areas of math does the lesson address? Recall our conversations about math in (a) our in-class activities, (b) various lessons we have observed, & (c) the NCTM Standards & Common Core Standards. This is to be much more specific than, say, “Geometry.” or “Measurement.” or “Area & perimeter.”

• How will you assess your students? Make sure you include information on how you will assess students. This does NOT need to be a worksheet (but it may be). You must be clear about how you will tell if students are meeting your learning goals (i.e., the assessment and the goals should be related). [Completing a worksheet in &
of itself is not such an indicator. I am sure many of you have done worksheets without having understood the concepts—I know I have.]

- If you will use any worksheets, overheads, etc., include them with the LP(s)—including draft versions—you turn in. (However, when submitting drafts, you do not need to make actual transparencies, paper copies will do as I may suggest revision of them.)
- Approximate time for each part of the lesson. How long will the intro take? Explaining the activity or problem? How long will you give students to work? Passing out materials? Etc.
- What materials do you need to have or prepare before the lesson?
- Any other info you deem important & necessary.

Feel free to utilize the Selection & Evaluation Criteria & the Problem Solving Goals in our text to help you plan.

**Details specific to the Bothwell week**

The Bothwell “mini-unit” is to be submitted by the group as a whole with CLEARLY stated indication of: a) who is teaching which lesson; b) the order of the lessons, and; c) any non-math lesson plans I might need to understand the math lesson plans (e.g., if data from an experiment in science is to be used in the math lesson, include the science lesson so I may be able to assess whether the data is appropriate, will support the math, etc.). Include a cover page listing the unit topic, an ordered list of lessons, and names of the group members. On a second page give an overview in narrative form of the mathematical flow of the lessons and justification for the sequencing of the lessons.

A complete draft version of the BMS LP set (all lessons for the week plus cover pages) is due **Oct. 27**. (Draft sets are drafts BUT MUST BE COMPLETE (see bold paragraph immediately preceding). A grade will be assigned the drafts. Assuming the drafts are complete when submitted, all points lost on the drafts may be earned through revision. (I.e., even a low score on the draft set may turn into a perfect score IF and ONLY IF the submitted draft was complete.))

I will return draft sets with comments & suggestions on Nov.3.

Final versions (revisions of the drafts as necessary) will be due **Nov. 10**.

I will return these with final grade for the assignment on Nov. 17.

You will be teaching at BMS the week of Dec. 1. We do not have class on campus that week.
BMS Reflection Assignment

**Due: Noon Dec. 8.**

*(I will happily accept reflections electronically IF they are emailed by 4 PM on Friday, Dec. 5. Be careful though: Make sure that I can read the photos/scans of the student work you submit as evidence (see below). If I can’t read it, I can’t assess it.)*

This reflection is individual. Each student will write a reflection on his/her Bothwell experience.

The reflection is geared toward the mathematics lesson you taught. However, it would certainly be appropriate to draw upon the other mathematics lessons you observed and/or the non-mathematics lessons you taught and observed. To offer a clear picture it may also be important to provide information about prior &/or subsequent lessons in the mini-unit.

First, describe the lesson you taught. This should be a thorough description of the lesson. You should describe what took place from the beginning of the lesson to the end. The description should include what the teacher said and did, what the students said and did, how the students were grouped, and so forth. The description should make clear what the mathematics was that the students were engaged in. This description should assume that I was not present to observe the lesson. *Include a copy of your LP with your reflection.*

Second, compare what actually took place (what you just described above) with your lesson plan. That is, describe in what ways the lesson followed the lesson plan &/or diverged from the lesson plan. Explain why the lesson diverged from the lesson plan if it did.

(The first two parts (above) are descriptive; they are not meant to be self-evaluative. The analytical part of the assignment follows. Note that, because a lesson departed from the LP by no means implies the teacher did something wrong. Actual lessons regularly depart from what is planned.)

Third, critique the lesson. Critiquing does not necessarily mean criticizing. Often movie reviews, which are critiques of movies, describe them in favorable terms -- or a mix of favorable and unfavorable terms. The idea here is to step back and decide what went well with the lesson and *why* it was successful; what might have gone better and *why* it was less successful. For example, you might decide that the students were not engaged to the extent you desired. You might decide that this was because of the activity that you assigned (it was too hard, too easy, uninteresting, unrelated to their lives, etc.), the way it was presented (you weren't clear in expectations, you gave them too much freedom, etc.), the grouping of students (too many per group, the wrong mix in some groups, etc.), or for one or more other reasons that you specify. Explain your reasoning (give support—say what happened that led you to you conclusions.).

Fourth, look at the goals and assessments for your lesson plan. Describe the extent to which your students met the goals. Your analysis should cover both understanding and able to do goals. Use the data that you collected from student assessments (worksheets, ongoing assessments, projects, etc.), as evidence to support your claims. *Attach the evidence* from students’ written assignments to your response. These should demonstrate students that *did not meet, met, and exceeded* expectations.
MA353 Methods and Materials in the Teaching of Elementary School Mathematics
Lakeview Elementary Weekly Reflection #1
Mathematics Classroom Observation – 20 points
Due the week of Sept. 22

For this first reflection, you are to observe the teaching of a mathematics class. Provide a description of what you observed along with your activities in the classroom. Describe the mathematical concepts that were being taught. If you worked with any students, describe your strengths in working with them and give at least one example of what you feel you need to improve upon. Below are some prompts that you should address in your summary. You should write a 2-3 page narrative about your experience. Do not just answer question-by-question with one or two sentences. You might think of responding with a paragraph or two to a group of questions. For example, questions 2-4 might be addressed as a group. (This same approach should be used for the subsequent reflections too.)

Prompts:
1. Describe the class you attended. What are the physical and non-physical attributes of the learning environment? Do you think they were conducive to learning? Why or why not?
2. How does the teacher open or begin the class?
3. What do you perceive the goal(s) of the lesson to be?
4. How does the teacher assess whether or not the goals have been met?
5. How does the teacher motivate the students for the lesson or individual activities?
6. What classroom management techniques does the teacher use?
7. What teaching strategies does the teacher use?
8. Describe the teacher’s nonverbal forms of communication, including classroom arrangement, body language and movement around the room.
9. How does the teacher provide for students who complete tasks quickly as well as work with students who need individual help?
10. Describe (a) technology-related learning tools and (b) other instructional aids that the teacher used.
11. How does the teacher end the class?
12. Does the teacher address different student learning styles? How?
13. Focus on the behavior of one student for a specific period of time (e.g. 5-8 minutes) and report how the student is responding to the lesson or activity.
14. What might you consider doing differently if you taught the lesson?
The purpose of this assignment is for you to experience working one on one with a student. Please work with your host teacher to identify a student with whom you can work (or with several students with whom you can work one-on-one over a couple week period) that will allow you to gain this experience.

Write a reflective summary of your experience working one on one with one or more students. Provide a description of the mathematical background of the student(s) with whom you worked, where your tutoring experience occurred (obviously Lakeview--but in the back of the room, the library, etc?), and what mathematical concepts you taught the student(s) including details of how you helped the student(s) gain a better understanding of those concepts. Include at least one example of success while working one on one and one example of what you need to improve upon. Explain how you think this experience contributed to your professional growth.
The purpose of this assignment is for you to experience working with students who have special needs (child at risk, ESL, ADD/ADHD, math anxiety, etc.). Below is a set of prompts for you to consider for this reflective summary. During your early weeks at Lakeview, you should spend some of your time observing learners with special needs in the classroom. Around the middle of the semester, work with some in a small group, with an aide, or one-on-one in order to gain more insight into the needs of these students.

Prompts:
1. Describe particular behaviors of the student that he or she seems to have difficulty self-managing.
2. If you observed the student in more than one subject area, did the student display different behavior patterns in different content area classes?
3. Did you recognize any discipline strategies implemented by any of the teachers to assist the student in managing his or her behavior?
4. If you observed the student during lunch, how did he or she interact with peers?
5. How did the student behave during a student-centered activity?
6. How did the student behave during a teacher-led activity?
7. Which learning style do you perceive this child to do best in (e.g. tactile/kinesthetic, auditory, visual)?
8. Did you notice any one in particular situation that triggered the student’s struggles or behavior issues, if observed?
9. Overall, what have you learned about students with special needs and their behavior through observing this student?
10. If you had a chance to work one on one with the student(s), describe the strategies that you used to help them better learn the concepts.
The purpose of this assignment is for you to participate in the development and teaching of a lesson. Below is an outline of the procedure for you to follow for this reflective summary.

- With your host teacher, determine a day and time that you will teach a mathematics lesson. If the teacher allows you to teach more than one lesson, take the opportunity to do so. Also, if you have the opportunity to participate in the development of intradepartmental and/or interdisciplinary lesson plans, please do so.
- Write a lesson plan that meets the requirements of the assignment attached to the syllabus. Get feedback on your lesson plan from your host teacher prior to teaching the lesson so that you can make any necessary modifications. When possible, provide me with a draft of your lesson so that I can provide feedback before you teach the lesson.
- On the day that you teach, your host teacher should observe your teaching. Please have your host teacher assess your teaching in writing so you can include this information in your reflection. (Let your host teacher know of this expectation before the day you teach.)
- After you have taught the lesson, respond to the prompts provided below to help you analyze and reflect upon the experience. Give specific details in your essay to support your answers and insights. Include a paragraph that summarizes what you learned from this experience.

**Prompts:**
1. What type of feedback or comments did your host teacher provide on your lesson plan?
2. Did your host teacher give you any reminders before you began teaching?
3. Describe the classroom learning environment.
4. What happened during the first few minutes of class before you began your lesson?
5. How did you introduce the lesson topic?
6. Did it appear that students were on task and understood the concepts you were teaching? What questions did the students ask?
7. How did you wrap-up the lesson?
8. What happened during the last few minutes of class after you finished your lesson?
9. Describe what went well and what you need to improve upon.
10. What is your reaction to the feedback your host teacher gave you?
You will spend time observing at least one other teacher’s mathematics class during your field experience. As you observe, think about the mathematical concepts being taught and how they are presented. If you work with any students, describe your strengths in working with them and give at least one example of what you feel you need to improve upon. Below are prompts that you should address in your summary.

**Prompts:**

1. Describe the class you attended. What are the physical and non-physical attributes of the learning environment? Do you think they were conducive to learning? Why or why not?
2. How does the teacher open or begin the class?
3. What do you perceive the goal(s) of the lesson to be?
4. How does the teacher assess whether or not the goals have been met?
5. How does the teacher motivate the students for the lesson or individual activities?
6. What classroom management techniques does the teacher use?
7. What teaching strategies does the teacher use?
8. Describe the teacher’s nonverbal forms of communication, including classroom arrangement, body language and movement around the room.
9. How does the teacher provide for students who complete tasks quickly as well as work with students who need individual help?
10. Describe (a) technology-related learning experiences and (b) other instructional aids that the teacher used.
11. How does the teacher end the class?
12. Does the teacher address different student learning styles? How?
13. Focus on the behavior of one student for a specific period of time (e.g. 5-8 minutes) and report how the student is responding to the lesson or activity.
14. What might you consider doing differently if you taught the lesson?
